

PicoScenes 许可证计划 (PSLP) v0.1.10

摘要：PSLP v0.1.10提供了免费和收费两档许可证。免费档覆盖了大部分常用功能，收费档额外提供高级功能特性+非常及时的技术支持。目前v0.1.10版收费档费率拟定为8688元年/台，并提供批量折扣。

许可证类型：PSLP v0.1.10设置了两档许可证：免费许可证Free License (FL) 和专业用户许可证Power User License (PUL)。FL授权对用户永久免费使用，但部分高级功能受限；**PUL授权用户在一台计算机上使用PicoScenes所有功能，但需按年订阅付费**，PUL可在不同计算机上切换。

许可证内容：PSLP涉及内容繁杂，大体归类为技术支持，平台特性和四种硬件(AX200, QCA9300, IWL5300以及USRp)三大方面。FL和PUL的功能区别具体见[PicoScenes许可证细节列表 v0.1.10](#)。此表格列出了PicoScenes最详细的功能与特性。

许可证时效：从2021年11月20日0点起，正式启动许可证机制。此时间之后，PicoScenes默认切换到FL，用户通过授权密钥或文件切换至PUL。

订阅费率：v0.1.10版PUL费率拟定为**8688元/年/台**。批量购买方面：一次性批量购买 $N, N \leq 7$ ，可享受 $(N - 1) * 8\%$ 折扣，例如一次性批量购买3台，可享受16%折扣；一次性订阅2年/3年可在批量折扣的基础上额外享受9%/18%折扣。PicoScenes团队将每两个月优化license的结构及细节，并上浮PUL费率100美元左右，既2022年1月生效的v0.2.x版PUL费率预计为9330元/年/台。

支付渠道：中文地区用户可在PicoScenes官方淘宝店（暂未就绪）选购，该淘宝店**可提供电子发票**；海外用户支付渠道正在建立，敬请期待。

深度定制化开发：2022年起开放面向科研机构或商业的定制化开发，欢迎商务洽谈。

PicoScenes License Plan (PSLP) v0.1.10

TL;DR: PSLP v0.1.10 offers two license options, free and paid. The former covers the most common features, and the latter provides the advanced features plus timely technical support. The subscription fee of the paid license is 1360 USD/computer/year with an extra bulk purchase discount.

License Types: PSLP v0.1.10 has two license options: **Free License (FL)** and **Power User License (PUL)**. FL is permanently free of charge but with limited access to some advanced features. The PUL grants user to use all PicoScenes features on one computer, and users will pay the annual subscription fee. The PUL subscribers can switch their PULs to different computers.

License Items: We divide the PSLP into three large feature sets: the technical support, platform features, and support for four CSI hardware (AX200, QCA9300, IWL5300, and USRP). The differences between FL and PUL are listed in [PSLP License Details v0.1.10](#). This table is most detailed list of the PicoScenes features.

License Timing: The PSLP will be activated on Nov. 20, 2021. After that, PicoScenes program will automatically switch to the FL by default. The PUL subscriber can activate their PUL using a license key or file.

PUL Subscription Fee: The subscription fee of PLSP v0.1.10 PUL is 1360 USD/computer/year. Bulk purchase discount: purchasing $N, N \leq 7$ subscriptions in one-time bulk will have a discount of $(N - 1) * 8\%$, e.g., 16% discount for 3 subscriptions in a one-time purchase. In addition, subscribing 2/3 years can have an extra 9%/18% discount. PicoScenes team will optimize the PLSP every two months and raise the subscription fee about 100 USD, i.e., for PLSP v0.2.x, which will be valid in Jan. 2022, the subscription fee will be round 1460 USD/computer/year.

Payment: Chinese users can purchase PUL subscription on PicoScenes Taobao Shop (not ready yet). The overseas payment channel is being established. Please stay tuned.

Customized Development: In 2022, we will accept business negotiation on research or commercial purposed customized development.

FL与PUL的主要区别（摘要版）

根据过去半年的试用反馈，FL与PUL的最主要区别不是技术层面，而是技术支持。PUL用户可以通过微信或其它IM联系我们，得到最及时甚至实时的技术支持。在几乎所有用户的评价中，技术支持都被认为最有价值。

在技术层面，FL保留了大多数Wi-Fi感知所需要的内容；而PUL可以访问很多PicoScenes的最新和最亮点的功能，例如多网卡支持、160MHz带宽的注入、QCA9300网卡的载波与带宽调节、基于USRP的MIMO等。

下表是二者详细的特性对比。

PicoScenes开发团队

The main differences between the FL and PUL (TL; DR version)

According to the trail feedbacks over the past six months, the main difference between FL and PUL is not the technical level, but technical support. PUL subscribers can reach us via WeChat or other IM, and we provide timely and even real-time support.

Technically, FL contains the most commonly used features for Wi-Fi sensing; while PUL retains the latest and the most highlighted features of PicoScenes, such as the multi-NIC support, 160-MHz bandwidth packet injection, arbitrary tuning for carrier frequency and sampling rate on the QCA9300 NIC, USRP-based MIMO Tx and Rx, *etc.*

The following table is a detailed functional comparison between FL and PUL.

PicoScenes许可证功能列表 v0.1.10 (PSLP License Details v0.1.10)

特性集/ Feature Set	特性 Feature	特性描述 Feature Description	FL	PUL	特性版本 Feature version
技术支持 Technical Support	完善的平台文档 Good documentation	https://ps.zpj.io	✓	✓	v0.1
	基于Issue Tracker的技术支持 Issue tracker-based technical support	最长36小时内回复 Reply in at most 36 hours	✓	✓	v0.1
	基于IM的非常及时、针对性的技术支持 Very timely and targeted technical support via IM	在微信或其它IM上成立专门的PicoScenes技术支持小组，空闲时可提供实时技术支持，最长12小时回复 Establish special technical support group on WeChat or other IM, providing real-time technical support if possible. Reply in 12 hours at most.			
平台特性 Platform Features	基于Debian apt的安装、更新、卸载 Debian apt-based installation, upgrade and uninstallation	新装系统的安装过程仅10分钟 Fresh new installation can be as short as 10 minutes.	✓	✓	v0.1
	PicoScenes MATLAB Toolbox	用于在MATLAB中解析PicoScenes生成的.csi文件；可自动升级 Parsing the .csi file in MATLAB; auto-upgradable	✓	✓	v0.1
	PicoScenes Python Toolbox (Release not before 2022)	用于在Python中解析生成的.csi文件 Parsing the .csi file in Python	✓	✓	v0.1
	CSI live plot	Rx端实时显示CSI幅度和相位 Rx end plots CSI magnitude and phase in real time	✓	✓	v0.1
	具有前向兼容的PicoScenes数据帧格式 PicoScenes Data format with forward compatibility	不用担心PicoScenes升级造成的已有数据无法解析问题 Forward compatibility guarantees the correct parsing of the old .csi data format during the future upgrade	✓	✓	v0.1
	丰富的网卡阵列控制脚本 Rich NIC control scripts	基于PCIE层次的网卡命名、批量配置等 PCIE hierarchy-based NIC naming, batch configuration, etc.	✓	✓	v0.1
	使用、开发 PicoScenes 插件 Using and Developing PicoScenes Plugins	PicoScenes Plugin Development Kit 开源 PicoScenes Plugin Development Kit is open sourced	✓	✓	v0.1
	并行多PicoScenes进程 Concurrent Multi-process of PicoScenes	多进程或用于某些复杂控制 Multi-Process may be easier for certain complex control		✓	v0.1
	多前端硬件支持(>=2块 COTS NIC或USRP) Multi-NIC or FrontEnd (>=2 COTS NICs or USRP)	可支持异构多网卡/USRP混合前端阵列 Support Multi-NIC/USRP hybrid frontend array		✓	v0.1
	连接AP测量CSI CSI measurement via AP connection	支持连接全协议(11a/g/n/ac/ax)、全带宽(20/40/80/160 MHz)、全频段(2.4/5 GHz)的AP，并对所有接收帧(除11b格式)测量CSI CSI measurement by connecting to Wi-Fi AP, supporting all protocol (11a/g/n/ac/ax), all bandwidths (20/40/80/160 MHz) and all bands (2.4/5 GHz)	✓	✓	v0.1
	监听模式测量CSI CSI measurement by “Monitor mode + Packet Injection”	支持在监听模式下对所收到的全协议(11a/g/n/ac/ax)、全带宽(20/40/80/160 MHz)、全频段(2.4/5 GHz)的帧(除11b格式)测量CSI CSI measurement for the overheard frames in monitor mode, supporting all protocols (11a/g/n/ac/ax), all bandwidths (20/40/80/160 MHz) and all bands (2.4/5 GHz)	✓	✓	v0.1

特性集/ Feature Set	特性 Feature	特性描述 Feature Description	FL	PUL	特性版本 Feature version
AX200	注入(Packet Injection) 信道带宽(CBW) 为20/40 MHz的11a/g/n/ac/ax格式帧	用于触发稳定频率的CSI测量；可指定20/40MHz带宽、MCS、MIMO、400/800/1600/3200 ns GI、BCC/LDPC编码；数据包内容为定制PicoScenesTxFrame格式；内容深度定制可借助PicoScenes-PDK插件	✓	✓	v0.1
	Packet Injection in 11a/g/n/ac/ax format with 20/40 MHz Channel bandwidth (CBW)	Packet injection can trigger CSI measurement in a constant rate. Capable of specifying 20/40 MHz CBW, MCS, MIMO, 400/800/1600/3200 ns Guard Interval (GI), BCC/LDPC coding. Packet content is with PicoScenesTxFrame format, can be further customized via PicoScenes-PDK plugins.			
	注入让IWL5300网卡触发CSI测量的包	有专用的“—5300”选项，可实现AX200(注入)→IWL5300(接收)的CSI测量	✓	✓	v0.1
	Inject packets that can trigger CSI measurement on IWL5300	Dedicated “—5300” option for AX200(Injection) -> IWL5300 (Rx in monitor mode) CSI measurement			
	运行切换信道及信道带宽(CBW)	无需暂定测量，通过命令或API直接控制控制信道、中心频率以及工作带宽	✓	✓	v0.1
	Change channel and bandwidth in real-time	Direct channel/CBW changing via API or command options			
	注入(Packet Injection) 信道带宽(CBW) 为80/160 MHz的11ac/ax格式帧	用于触发稳定频率的CSI测量；可指定80/160 MHz带宽、MCS、MIMO、400/800/1600/3200 ns GI、BCC/LDPC编码；数据包内容为定制PicoScenesTxFrame格式；内容深度定制可借助PicoScenes-PDK插件		✓	v0.1
	Packet Injection in 11ac/ax format with 80/160 MHz Channel bandwidth (CBW)	Packet injection can trigger CSI measurement in a constant rate. Capable of specifying 80/160 MHz CBW, MCS, MIMO, 400/800/1600/3200 ns Guard Interval (GI), BCC/LDPC coding. Packet content is with PicoScenesTxFrame format, can be further customized via PicoScenes-PDK plugins.			
	对任意来源包测量CSI	对任意源地址(Source Address)的帧测量CSI	✓(受限，仅对最初收到6个地址测量)	✓	v0.1
	CSI measurement for all source MAC address	CSI measurement for all the overheard frames which are with different source MAC address			
	获得FTM时钟计数	硬件底层使用的320MHz时钟原始计数，每4秒一周，可用于精确同步		✓	v0.1
	Obtain Fine-Timing Measurement (FTM) clock count	The raw clock count from the 320 MHz baseband clock. About 4s a round. Useful for precise synchronization			
	测量指定Frame Type帧的CSI	指定基于Frame Type的过滤，例如指定仅对Beacon Frame类型测量CSI		✓	v0.1
	CSI measurement for the specified frame types	CSI measurement for the specified frame types, e.g., measuring CSI only for Beacon Frames			
	监听模式测量CSI	QCA9300网卡仅支持对“指定其MAC地址且not_sounding=OFF的11n协议帧”测量CSI	✓	✓	v0.1
	CSI measurement by “Monitor mode + Packet Injection”	QCA9300 NIC hardware reports CSI only for 11n frames with HT-rate flag not_sounding=off			
	注入(Packet Injection) 信道带宽(CBW) 为20/40 MHz的11a/g/n格式帧	用于触发稳定频率的CSI测量；可指定20/40MHz带宽、MCS、MIMO、400/800 ns GI、BCC/LDPC编码以及not_sounding标记；数据包内容为定制PicoScenesTxFrame格式；内容深度定制可借助PicoScenes-PDK插件	✓	✓	v0.1
	Packet Injection in 11a/g/n/ac/ax format with 20/40 MHz Channel bandwidth (CBW)	Packet injection can trigger CSI measurement in a constant rate. Capable of specifying 20/40 MHz CBW, MCS, MIMO, 400/800 ns Guard Interval (GI), BCC/LDPC coding and not_sounding flag. Packet content is with PicoScenesTxFrame format, can be further customized via PicoScenes-PDK plugins.			
	注入让IWL5300网卡触发CSI测量的包	有专用的“—5300”选项，可实现QCA9300(注入)→IWL5300(接收)的CSI测量	✓	✓	v0.1
	Inject packets that can trigger CSI measurement on IWL5300	Dedicated “—5300” option for QCA9300(Injection) -> IWL5300 (Rx in monitor mode) CSI measurement			
	Tx通道指定	指定某个Tx通道是否参与发送	✓	✓	v0.1
	Tx chain specification	Specify which Tx chains are used for Tx			

特性集/ Feature Set	特性 Feature	特性描述 Feature Description	FL	PUL	特性版本 Feature version
QCA9300	Rx通道指定	指定某个Rx通道是否参与接收	✓	✓	v0.1
	Rx chain specification	Specify which Rx chains are used for Rx			
	接收启动了11n ESS特性的包	Extra Spatial Sounding (ESS)是11n引入的机制，通过发送额外的HT-LTF段，可以实现对于单空间流帧有两个间隔为4us的连续CSI测量	✓	✓	v0.1
	CSI measurement for 11n frames with ESS feature on	Extra Spatial Sounding (ESS) is an 11n-introduced feature, which transmits extra HT-LTF segment, achieving 4-us spaced dual CSI measurement for 1-stream frame			
	访问非标准频段	QCA9300网卡硬件可在[2.2-2.9] GHz和[4.4-6.1] GHz范围内细粒度调节中心频率	✓(受限，仅提供[2.3-2.5] GHz)	✓	v0.1
	Access non-standard carrier frequency range	QCA9300 NIC hardware can operate in [2.2-2.9] and [4.4-6.1] GHz carrier frequency range with fine granularity	✓Limited, [2.3-2.5] GHz only)		
	访问非标准带宽	QCA9300网卡硬件可在[2.5,80] MHz以每2.5 MHz为步长调节基带工作频率	✓(受限，仅提供10/30 MHz)	✓	v0.1
	Access non-standard baseband sampling rate	QCA9300 NIC baseband can operate in [2.5-80] MHz baseband sampling rate with 2.5 MHz step	✓(Limited, 10/30 MHz only)		
	手动指定Rx增益	关闭硬件AGC功能，实现幅度稳定的CSI测量，Rx增益手动调节范围[0-66] dBm	✓(受限，仅提供[0-20] dBm)	✓	v0.1
	Manual Rx gain control	Turning off the hardware AGC and obtaining stable CSI measurement. Manual Rx control within [0, 66] dBm.	✓(Limited, [0-20] dBm only)		
	注入启动了11n ESS特性的帧	可以实现面向IWL5300/QCA9300/USRP的单空间流双CSI测量，AX200不支持对ESS的测量		✓	v0.1
	Inject ESS-enabled 11n frames	Achieving dual-CSI measurement from 1-stream packet on IWL5300/QCA9300/USRP receiver. AX200 doesn't support ESS measurement.			
IWL5300	连接AP测量CSI	IWL5300需连接11n协议的开放AP（无加密）	✓	✓	v0.1
	CSI measurement via AP connection	IWL5300 must be connected to 11n format Open System AP			
	监听模式测量CSI	IWL5300仅支持对发送给魔术MAC地址(magic MAC address)的11n帧测量CSI	✓	✓	v0.1
	CSI measurement by “Monitor mode + Packet Injection”	IWL5300 reports CSI only for the 11n frames sent to a magic MAC address			
	注入(Packet Injection) 11a/g/n协议帧	可指定20/40MHz带宽、MCS、MIMO、400/800 ns GI	✓	✓	v0.1
	Packet Injection with 11a/g/n format	Capable of specifying 20/40 MHz bandwidth, MCS, MIMO, 400/800 ns GI			
	运行时切换信道及信道宽带（CBW）	无需暂定测量，通过命令或API直接控制控制信道、中心频率以及工作宽带	✓	✓	v0.1
	Channel changing and bandwidth in real-time	Direct channel/CBW changing via API or command options			
	不重启一键切换固件	切换CSI测量固件或一般上网用固件	✓	✓	v0.1
	Switch IWL5300 firmware without reboot	Switch between the special CSI measurement and ordinary firmware			
	Tx通道指定	指定每个Tx通道是否参与发送	✓	✓	v0.1
	Tx chain specification	Specify which Tx chains are used for Tx			
	Rx通道指定	指定每个Rx通道是否参与发送	✓	✓	v0.1
	Rx chain specification	Specify which Rx chains are used for Rx			
	接收启动了11n ESS特性的包	Extra Spatial Sounding (ESS)是11n引入的机制，通过发送额外的HT-LTF段，可以实现对于单空间流帧有两个间隔为4us的连续CSI测量	✓	✓	v0.1
	CSI measurement for 11n frames with ESS	Extra Spatial Sounding (ESS) is an 11n-introduced feature, which transmits extra HT-LTF segment, achieving 4-us spaced dual CSI measurement for 1-stream frame			
	支持所有USRP型号	B210/N210/X310经过测量，E3x0/N3x0/X4x0没有测试过	✓	✓	v0.1
	Support all USRP models	B210/N210/X310 tested, E3x0/N3x0/X4x0 not test			

特性集/ Feature Set	特性 Feature	特性描述 Feature Description	FL	PUL	特性版本 Feature version
	支持多USRP合并 Multi-USRP combination	多个N2x0或X3x0系列可合并为一个大的MIMO USRP		✓	v0.1
		Multiple N2x0 or X3x0 USRPs can be merged into one MIMO USRP			
	在非标准频段工作 Access non-standard carrier frequency range	需在USRP子板支持范围内	✓(受限, 仅提供 [2.3-2.5] GHz)	✓	v0.1
		Should be within the range of USRP daughterboard	✓(Limited, [2.3-2.5] GHz only)		
	在非标准带宽工作 Access non-standard sampling rate range	需在USRP主板支持范围内	✓(受限, 仅提供 10/30 MHz)	✓	v0.1
		Should be within the range of USRP motherboard	✓(Limited, 10/30 MHz only)		
	手动指定Rx增益 Manual Rx gain control	PicoScenes基带没有实现AGC, 需要手动指定Rx Gain	✓	✓	v0.1
		PicoScenes on SDR does not implement AGC, therefore manual RX gain control			
	Tx通道指定 Tx chain specification	指定某个Tx通道是否参与发送	✓	✓	v0.1
		Specify which Tx chains are used for Tx			
	Rx通道指定 Tx chain specification	指定某个Rx通道是否参与接收	✓	✓	v0.1
		Specify which Rx chains are used for Rx			
	Tx基带信号录制 Record Tx baseband signal	录制在一次会话中生成的所有基带信号		✓	v0.1
		Record Tx baseband signal to file			
	Tx基带信号回放 Replay Tx baseband signal	将预生成的(或录制)的基带信号发射出去		✓	v0.1
		Transmit the pre-generated or recorded Tx baseband signal			
	Rx基带信号录制 Record Rx baseband signal	录制在一次会话中的Rx接收到的基带信号, 既原始I/Q		✓	v0.1
		Record Rx baseband signals to file, i.e., the raw I/Q signals			
	Rx基带信号回放 Replay Rx baseband signal	将预生成的(或录制)的基带覆盖实时Rx流, 用于离线基带信号解析		✓	v0.1
		Override the Rx stream with the pre-generated or recorded Rx signals, suitable for off-line Rx signal decoding			
	TX CFO	重采样Tx信号, 施加指定的Carrier Frequency Offset (CFO)		✓	v0.1
		Resample the Tx baseband signal and exert extra Carrier Frequency Offset (CFO)			
	TX SFO	重采样Tx信号, 施加指定的Sampling Frequency Offset (SFO)		✓	v0.1
		Resample the Tx baseband signal and exert extra Sampling Frequency Offset (SFO)			
	RX CFO	重采样Rx信号, 施加指定的Carrier Frequency Offset (CFO)	✓	✓	v0.1
		Resample the Rx baseband signal and exert extra Carrier Frequency Offset (CFO)			
	RX SFO	重采样Rx信号, 施加指定的Sampling Frequency Offset (SFO)	✓	✓	v0.1
		Resample the Rx baseband signal and exert extra Sampling Frequency Offset (SFO)			
	Tx Resampling	通过基带重采样绕过USRP整数倍带宽数量有限的问题	✓	✓	v0.1
		Up-sampling the Tx baseband signal to W/A USRP integer factor problem			
	Rx Resampling	通过基带重采样绕过USRP整数倍带宽数量有限的问题	✓	✓	v0.1
		Down-sampling the Rx baseband signal to W/A USRP integer factor problem			
	Tx I/Q Imbalance	指定Tx I/Q不平衡数值(幅度与相位)		✓	v0.1
		Add Tx I/Q imbalance factor (mag and phase)			
	Rx I/Q Imbalance	指定Rx I/Q不平衡数值(幅度与相位)		✓	v0.1
		Add Rx I/Q imbalance factor (mag and phase)			

特性集/ Feature Set	特性 Feature	特性描述 Feature Description	FL	PUL	特性版本 Feature version
USRP	20/40 MHz信道带宽 (CBW)对全协议、全来源帧测量CSI	注：SDR软基带基于CPU软解，丢包不可避免，MIMO/大带宽/LDPC/MU-MIMO/ OFDMA都会提升丢包率	✓(受限，不支持MIMO)	✓	v0.1
	CSI measurement for frames with 20/40 MHz bandwidth	Note: packet loss is inevitable for software-based SDR baseband. MIMO/ large bandwidth/LDPC/MU-MIMO/OFDMA will cause more packet loss.	✓(Limited, no MIMO support)		
	注入让IWL5300网卡触发CSI测量的包	有专用的“—5300”选项，可实现USRP(注入)→IWL5300(接收)的CSI测量	✓	✓	v0.1
	Inject packets that can trigger CSI measurement on IWL5300	Dedicated “—5300” option for USRP (Injection) -> IWL5300 (Rx in monitor mode) CSI measurement			
	注入让QCA9300网卡触发CSI测量的包	默认开启HT rate sounding标记	✓	✓	v0.1
	Inject packets that can trigger CSI measurement on QCA9300	Setting HT-rate flag not_sounding=Off by default			
	80/160 MHz信道带宽 (CBW)对全协议、全来源帧测量CSI	注：SDR软基带基于CPU软解，丢包不可避免，MIMO/大带宽/LDPC/MU-MIMO/ OFDMA都会提升丢包率		✓	v0.1
